Discursive evaluation in a distributed learning community

Lars Svensson
University of Trollhättan Uddevalla, Sweden

This paper describes a distance education project where a threaded discussion board was used for interaction amongst students and teachers. The experiences from the first year of the project shows that such a forum can be an important complement to other evaluative resources in order to monitor student's expectations and experiences. Furthermore, it is argued that discursive evaluations can establish a learning community with shared norms and forms of communication and collaboration. Vital properties of the discussion board are that it is continuous, online, public, asynchronous and auto-structuring.

1. Evaluation in distance education

Evaluation is an important tool in higher education, guiding faculty and management towards better courses with improved methods of teaching and administration. The literature describes many formal techniques and instruments for this purpose (eg. Oliver 1997). Since most methods for evaluation require substantial resources for measuring as well as analysis, the dominating instrument is probably a simple, written post-course questionnaire with multiple choice questions and/or open ended short comments (Hall 1997). In addition to the results from formal evaluation, teachers have a rich flow of more informal and sometimes subtle feedback arriving continuously from a variety of sources. Casual conversation with students and colleagues, the atmosphere in classroom and corridors and student's body language and degree of attention during a lecture can all be viewed as carriers of evaluative feedback (Svensson & Sørensen, 2002). Informal feedback, such as this, is of course not only interpreted by faculty members. For students this feedback can be a vital element in processes of, for example, socialisation and maintenance of the class community.

In a distance educational setting, with students and teachers separated in time and space, these signals are drastically reduced. Compensation for
this type of informal communication with computer mediated interaction is difficult, if even possible. Whittaker et al (1994) address the general issue of designing IT to support informal workplace communication, arriving at the conclusion that a shared workspace is an important aspect and that rich, synchronous video media and asynchronous, text based media should be combined and integrated when aiming for an acceptable design.

The focus of this paper is a threaded discussion board where students and teachers meet to discuss course related issues. This is an informal arena of conversation where students can express their attitudes, opinions, perceptions and experiences. Such a forum can serve as a valuable complement to traditional post-course questionnaires, even making it possible for teachers to challenge and manage the students’ opinions. The arguments are based on experiences from a distance education project at a university in Scandinavia. The empirical data of the study are the entries made by students and teachers to a web based computer conference (discussion board). This conference is integrated into a web education system developed at the university. The entries have been analysed with respect to evaluative factors such as topic and nature.

2. The case

The object of the study is a distance education project where 60 students from six small communities in the outlying districts of a university in Scandinavia can study for a BSc degree in System Analysis. The participating communities were committed to provide some basic facilities such as access to modern computers with Internet connection, a prescribed set of software packages, a video conference (VC) studio and a room for collaborative work. In all the communities these facilities are located in a learning centre with a part time (20%) coordinator providing elementary service to the students. The number of students in the various communities varied from five to 17.

The study covers the courses during the first year of the project (Table 1). All courses had different teams of teachers and different methods of teaching and examination.

Table 1: Course modules covered by the study

| Mathematics and Statistics   | 10 weeks |
| Computer Science             | 10 weeks |
| Business Administration      | 10 weeks |
| Finance                      | 5 weeks  |
| C++ Programming              | 5 weeks  |
A common denominator in all courses was the use of learning technologies. Multiparty VC sessions were used for lectures, seminars and presentations, and a web education tool was used for distribution of course material and for text based interaction. The system provided a web site for each course, one of its components is the core object of this paper, namely the Discussion Board - a primitive web based conference, where discussion topics are divided into threads presented on the screen with indents that indicate the structure of the discussions. Each entry is presented with a hyperlinked title, a date and time stamp and the signature of the debater. The threads are sorted in descending time order with respect to the first entry of each thread. An entry is displayed in full text by clicking on the title, it is then possible to choose to post a follow up to the entry. In addition to text (with html tags if so desired) the author of an entry can choose to submit a picture, a URL and/or an email address. Each entry should be signed with a name or a pseudonym by the author. A new discussion thread is started in the same manner. Laurillard (1993) classifies the debate board to be a discursive medium defined as:

Both teacher’s and student’s conceptions are accessible to the other and both topic and task goals can be negotiable; students must be able to act on, generate and receive feedback on descriptions appropriate to the topic goal; the teacher must be able to reflect on student’s actions and descriptions and adjust their own descriptions to be more meaningful to the student (p. 100).

Using her conversational framework she claims that discursive media addresses interaction at the level of description and reflection upon actions, feedback and goals. Long & Baecker (1997) emphasise the conversational style of a discussion board, which allows for conversation among groups where each person can respond to all others, while having the complete dialog history displayed.

2.1. Previous research

In a previous study the email and discussion board entries for the course Mathematics and Statistics were analysed using a method designed by Yates and Orlikowski (1993). This method uses the concept of genre to detect patterns in the electronic interaction. They define a genre to be a:

Typified communicative act having a socially defined and recognised communicative purpose with regard to its audience.

The genre concept accounts for both the substance and the form of the interaction. Substance refers to the topics and the discursive structure of the interaction, and form has three sub-dimensions: structural features, communication medium and language. The concept of a genre repertoire (Orlikowski & Yates 1994) refers to a set of genres providing a social template for communication within a community. The audience or
community in this case is of course the group of students and staff (teachers, course administrators) interacting through the course web site. The results revealed a genre repertoire that consisted of three distinct genres that appeared both on the discussion board and in the email to teachers. The genres were labelled Query, Feedback and Smalltalk (See Svensson 2002 for a thorough discussion).

The Query genre was characterised by having the primary purpose of discussing exercises and aspects of the course literature. The purpose of the Smalltalk entries is to entertain and socialise even though the content is often related to some course activity. Social activities like this are often observed in distance learning projects (Fjuk 1998), and serve an important role in building and maintaining the learning community. These entries can to some extent be a substitute for subtle feedback signalling the mood of the students, as cited in the first section. However the focus in this paper is more directly linked to the Feedback genre which constitutes the foundation for the analysis reported in this paper.

3. Data collection and analysis

The aim of this explorative study is to present as rich a picture as possible of the nature of the evaluative discourses that took place on the discussion boards. The primary unit of analysis is the discussion thread. All threads with an evaluative content were included in the study.

<table>
<thead>

<tr>
<td>Teacher performance</td>
<td>Comments on lectures and tutoring.</td>
</tr>
<tr>
<td>Debate climate</td>
<td>Comments on the form or style of other debaters.</td>
</tr>
</tbody>
</table>

The threads were grouped and classified with respect to the feedback topic or topics (Table 2). The process of grouping the threads into topic clusters with relevant labels was conducted in an iterative way, inspired by grounded theory techniques (Glaser & Strauss, 1980). If a thread did not stay focused on one topic, ie. if two or more entries belonged to another of the emergent topics, the thread was classified as having two topics.
Secondly, each debate board entry was analysed with respect to the nature of the feedback. Inspired by the classification of different types of feedback a teacher can give a student (presented by Draper 1997b) the following scheme was adopted.

**Feedback types**

- Agree/Disagree with other debater
- Success/Failure: Debater stating that something is bad (or good)
- Behaviour recipe: Debater presenting a suggestion for change
- Explanation: Elaboration on why something is wrong (or right)

The entries were classified into one or more of these feedback types.

Some simple quantitative measures such as number of entries, the number of follow up levels and the time span between first and last entry were recorded in order to give complementary information on the nature of the debate. In addition to analysing the debate entries, the log files containing data on all visits to the debate boards were analysed.

### 4. Results and analysis

The log file data shows that the discussion boards have been frequently visited, with a total of over 12,000 visits over a 40 week period. This resulted in 223 threads with 563 entries (one out of 20 visits resulted in a posting). 50% percent of the threads (60% of the entries) were classified as feedback threads and therefore included in the study.

#### 4.1. Thread topics

The analysis of the topics revealed that a majority of the evaluative threads focused on one and sometimes two topic categories (Table 3). The topics cover a broad spectrum of issues related to the educational setting, as well as a “meta-topic” with discussions on how to behave on the forum itself.

Comparing the courses shows that the frequency of the debate is fairly equal in the first three courses and drops slightly in the last two. Also, the length of the threads drops from an average of 3-4 in the first 30 weeks, to no more than 2 in the last ten weeks. The fact that the 5-week courses tend to be more intense could be one possible explanation. Another explanation could be the fact that issues related to the web based system were frequently debated in the first courses, but gradually the system became more and more transparent to the students and was therefore not an interesting topic to debate. In the latter courses the technology threads related to how it was operated by teachers and integrated with course content.

</tbody>
</table>

The short threads and solo entries could be found in all categories, but dominated in Learning technology and Debate climate. The longest discussions were concerned with the context or the content of the courses. The lifetime of most discussions were very short (1 or 2 days). Only three threads had a span of more than a week between the first and the last entry. One explanation to this could perhaps be found in the graphical interface of the debate board. Since the complete dialog history was presented on the screen, the threads disappeared from the start screen of the board after 15-20 entries have been made. Then the scroll bars must be used in order to read the entries or post a follow up. There were some examples where debaters chose to start a new thread continuing the debate on an existing topic, instead of adding to the original thread.

4.2. Nature of feedback

In Table 4 the entries are divided with respect to the nature of feedback. It is worth noting that an elaborate explanation or a suggestion for changes is included in 53 percent of the entries, leaving only 47 percent with short answer reports on success/failure or commenting someone else’s opinion. The ratio of agree/disagree entries is a fairly good indicator of the degree of discussion or debate on the board. A low ratio would suggest a collection of weakly interrelated entries, as on a bulletin board. A high ratio on the other hand would point towards a discursive nature of the content, like in a conference. The table shows that one out of four entries has been categorised as agreeing or disagreeing to a previous posting, clearly indicating that the forum is more of a conference, and less of a bulletin board. This is even more enhanced when excluding the starting entry (seed) of each thread, which for natural reasons is not likely to agree or disagree with previous postings. Then we see that close to 40 percent of the “follow ups” falls into category 1 (or 1&3 or 1&4).

4.3. Thread examples

In order to visualise the debate, three examples of complete threads are presented below. The first thread (Figure 1) is from the computer science course and deals with a course context issue. The header of the first entry was "Why not COOP??", referring to the fact that students on the distance education program did not have the opportunity to integrate work placements with their studies.

The second example (Figure 2) is a short thread on Learning technology from the beginning of the first course and the third example (Figure 3) deals with the debate climate of the second course as well as the use of outdated software. Descriptions in italics are translations from debate board entries (in some cases, somewhat shortened).

5. Understanding the discursive evaluation

The results reveal a durable phenomenon, where students voluntarily initiate and commit themselves to evaluative discussions. This section will discuss this phenomenon focusing on the following questions: What are the key elements that motivate students to participate in the discursive evaluation? What are the strengths and weaknesses of using threaded discussion forums for evaluative purposes? and How do the properties of the application itself affect the outcome?

5.1. Community

A growing body of literature focuses on trying to understand the nature of what is often referred to as a virtual community (eg. Rheingold, 1993) or
I think it's shocking that distance students are not offered to take the COOP version. They did actually say, before we started this program, that we would be offered the same conditions as the regular program. Am I the only one that feels betrayed?

I also think we should have the opportunity to do COOP-studies. It is important to try new knowledge in a practical work setting...

I do not think you should feel betrayed. The distance program is different in the sense that it needs all students to take the same course at the same time. If you want the COOP-version you must apply for the regular program.

Comapses that shifting to regular version cannot be done automatically

Explains the procedure for study-guidance

Inform about has been poor on this subject

Agrees with D and A

Further explanation to why COOP is impossible

Disagrees with C's arguments

Agrees with F but thinks C for doing a good job

Thanks everyone for their opinions

I think the debate has become too much one-sided and I must admit that I don’t agree with the harsh critique that has been presented. I am especially hurt by the “reductionism” used in the complaints about the choice of computer platforms and software. I have prior experience of university students and I can assure you that I have never experienced a department that could afford to keep up with the latest hardware & software-releases ...

Agrees with A. I think the debate is one-sided, but claims that the computer standards at the distance education are much worse than on campuses. 

... I completely agree with A.

And I know at least 3 computers that still works with win 3.1.1. And please, there are very few things that are black or white in this world, to stop tagging.

Agrees with B and disagrees with C on choice of hardware/software

Figure 3: Debate climate thread

To whom it may concern

Could it be arranged so that one can see how the submission of a file proceeds in the ‘Hand-In Category’? Perhaps a terminal window where you can see that everything is going alright and an indicator showing how much time is left. Sure, I can see the lights blinking on my modem, but if I use a computer at school or one with a build-in modem. I can only guess what is going on. Perhaps you can throw in some music during the transmission process? Ode to a media brass band.

We have been thinking of some kind of confirming function... it will be implemented in a while when I can find the time. However, you can forget about the brass band :)
an online discourse (Erickson, 1997). Most scholars agree that the notion of critical mass is important in order for durable communities to evolve, (Bradner et al. 1999) This refers to the fact that discussions tend to decline and vanish if the rate of visitors and new entries are too low.

Ågren (1999) argues that an important motivational factor, besides learning and interest in the topic, is the acquiring of social capital that comes from active participation in the discussions. In this case, it is merely possible to speculate regarding to what extent such a generic motivational factor contributed. Ackerman and Starr (1995) highlight how awareness of the activities of other community members can be valuable for members of a geographically dispersed community. In the context of the case reported in this paper, this could be interpreted as a collective interest in being aware of the conditions at the other (remote) sites. The discussion forum then serves as an arena for sharing experiences, expectations and frustration throughout the community. Hara and Kling (1999) explore the issue of student frustration, concluding that this is a major problem in distance education. In a case study of a North American DE project, they identify three sources of frustration: technology failure, lack of prompt feedback and ambiguous instructions, all of which are topics discussed at various times in this study. Viewing the discursive evaluation from the perspective of frustration, it seems as though engaging in discussions concerning the issues that are frustrating to the individual can help in reducing the frustration. This can be accomplished in several ways, for instance, by clearing misunderstandings, by finding out that others are experiencing the same, etc.

5.2. Evaluation

It is important to emphasise that the opinions expressed by students on the discussion boards cannot be uncritically regarded as being representative for the whole learning community. Hall (1997) and Wheeler (1997) argue that studying computer conference interactions can be biased by the fact that students tend to participate in the debate to a varying extent. Hall claims that technology friendly students are quicker in adopting the medium, and will therefore be over represented. Issues such as fear for lack of anonymity and reluctance to express one's opinion in writing could imply that some students hesitate to participate in the debate. Furthermore, the familiar and ‘talk like’ language generally reported to be a characteristic of text based computer interaction (Sproull & Kiesler 1991), could enhance the wish to express written opinions, compared to other evaluation techniques like open ended questionnaires.

Regardless of whether the debate reflects a representative image of student attitudes or not, one can question the evaluative effect of such a
Draper et al (1996) declare that any evaluation designed to monitor students’ attitudes is weak with respect to the evaluation of educational effect, since what is measured is really students’ experience compared to their expectations. They argue that the validity of such evaluations is particularly low when it comes to students’ expectations of computer aided learning, since these educational settings are not familiar and well established for the students. Still, they acknowledge attitude measurements to be an important tool for teachers wanting to respond and manage these attitudes. Especially in a distance educational setting, when students and teachers seldom meet face to face, it can be difficult to keep track of students’ attitudes (Hall 1997).

However, the debate board is very well suited for both discovering these perhaps diverse expectations, and even challenging and discussing them. In fact the debate could serve as means for smoothing out these differences. Hall (1997) reaches a similar conclusion. She says that using the content of a computer conference for evaluative purposes could be productive when wanting to find personal, subjective opinions among students. The illuminating qualities of the discourse could serve as a complement to a more summative post-course questionnaire. Such questionnaires are perhaps more valid in terms of representing the attitudes of the whole community, but often suffer from short comments without elaborate explanations on complaints and suggestions.

Another aspect that could be argued to add to the evaluative quality of the discussion board is the fact that students are probably less likely to perceive such a forum as an instrument of evaluation, thereby avoiding some of the bias that characterises other, more formal evaluative efforts. When a situation is identified as an evaluation, through for instance promises of anonymity, the students are likely to enter a role (Goffman, 1969), where the existing power relationships between them and the teacher affects what is and what is not said.

5.3. Application

There are several important properties of the debate board itself, which can separately as well as collectively contribute to the way it is used. In addition to these qualities there are of course also other essential factors of the learning context that will affect the outcome.

The debate is public,
The fact that all entries can be read by everyone in the community serves at least three essential purposes. Firstly, the risk of minority opinions being overestimated is reduced since such entries are likely to be contradicted by others. Secondly, it makes it more interesting for students
to express an opinion when they know that it will be read by more people than the teacher. This can be a strong implication for change. For example, when a student from one of the communities entered a complaint on bad service from a local facilitator, a student from another community responded with commending the perfect conditions on his site. The next entry (a day later) was from the first student reporting on a fast recovery. A third feature related to the public nature of the board is its social functions. The existence of the Smalltalk genre (Svensson 2002) points to the fact that debaters use the board for social purposes. It cannot be ruled out that an evaluative entry to the board is more of a social action than an actual wish to give feedback.

Auto-structuring,

The Debate Board was originally intended as a place where students could discuss issues related to the content of the course, but there were no attempts made to regulate or moderate the use in any way. The result of this study indicates a drift towards a more social and evaluative use. This kind of technology drifting is common when IT is used for collaborative purposes (Ciborra 1996). There is of course no guarantee that students will use the debate board for evaluation, but if they chose to do so, the entries are automatically sorted into threads, making topic oriented analysis easier for an evaluator or teacher. If the debate is regulated (ie. suggested topics for discussion) the threads can still provide good structure with respect to sub-topics. However, if the regulation is too strict, there is a risk of losing the discursive structure supported by the threads. At some point it will become arbitrary whether a new entry should start a new thread or add to an existing one.

Asynchronous,

Laurillard (1993) argues that the asynchronous nature of a discursive medium can contribute to students making more carefully thought through and ‘well formulated’ entries, reducing the risk for misunderstandings in analysing the content. Draper (1997a) argues that reflecting on one’s own writing is a form of ‘self feedback’, that promotes learning. In the same way, taking time to reflect on other debater’s viewpoints can induce a similar intellectual process.

...and Continuous

Draper et al (1996) says that an important constraint in evaluation is not to overload students. On the debate board they only express their opinion when they want to do so. This is not the case in traditional post-course evaluations, where many issues worth giving comments on are long since forgotten. Furthermore, it reduces the risk for students to think “Why should I bother to comment on this, when it’s already too late for me to
benefit from the impact of my viewpoints?” The possibility that suggested changes could be implemented and reported errors could be dealt with is likely to enhance students’ willingness to give constructive feedback.

5. Conclusion

The paper has identified and discussed three major aspects regarding the use of a discursive medium as a forum for educational evaluation.

i. The discussion serves the purpose of supporting the creation of an online community of students and teachers where attitudes, expectations and opinions can be shared and discussed. The results reveal how such shared experiences, regarding for instance the students’ frustration and satisfaction, are frequent topics for discussion. The existence of a meta-discussion on shared norms for the evaluative debate is also evidence of an online community.

ii. The forum proved to be an interesting instrument of evaluation, with characteristics that complement traditional methods of evaluation. The results from the case study show discussions in many course related topics that are rich with constructive suggestions and argumentation. This feedback constitutes valuable input for teachers, but perhaps even more important, it makes it possible to challenge and influence students’ attitudes and expectations. Especially in distance educational settings, where students and teachers seldom meet in person, it is important to identify ways of picking up sentiments and sources of irritation. A discursive medium like the discussion board presented in this paper should not be perceived as a formal instrument for objectively evaluating a learning context. On the contrary, it is a forum for conversations and discussions for the learning community of students and teachers, perhaps to some extent compensating for the loss of informal communication channels of the campus based education.

iii. Finally the functionality and design characteristics of the application itself was argued to influence the nature of the discourse, thereby affecting both processes of community building and the educational evaluation. The continuous, public, asynchronous, and auto-structuring nature of the medium are all presented as key characteristics. The results also suggest that the graphical interface might impact aspects such as the lifetime of a discussion thread.

The explorative nature of the study, and the fact that the conclusions are based on one single case, implies that further research will be needed in order to strengthen the claims and help address questions not thoroughly
explored in this paper. For instance, can similar outcome be achieved using other types of communication technology, (eg. synchronous and or audiovisual media)? How would the discussion be affected by stronger moderation? In what ways and to what extent would a redesign of the application influence the discursive evaluation?
